## Connectivity

**Handshaking lemma.** For any graph  $G$ ,

$$\sum_{v \in V(G)} \deg v = 2|E(G)|.$$

**Lemma 2.1.** If there exists a walk in  $G$  with ends  $u, v$  then there exists a path in  $G$  with these ends.

**Lemma 2.2.** A graph  $G$  is not connected iff there exists a partition  $(X, Y)$  of  $V(G)$  such that no edge of  $G$  has one end in  $X$  and the other in  $Y$ .

**Lemma 2.3.** If  $H_1, H_2$  are connected subgraphs of  $G$  and  $V(H_1) \cap V(H_2) \neq \emptyset$ , then  $H_1 \cup H_2$  is connected.

**Lemma 2.4.** Every vertex of  $G$  belongs to a unique connected component.

**Lemma 2.5.** A subgraph  $H \subseteq G$  is a connected component of  $G$  iff  $H$  is connected, and if  $e \in E(G)$  has an end in  $V(H)$  then  $e \in E(H)$ .

**Lemma 2.6.** Let  $e \in E(G)$  with ends  $u, v$ . Then exactly one of the following holds.

1.  $e$  is a cut edge,  $u$  and  $v$  belong to different connected components of  $G \setminus e$ , and  $\text{comp}(G \setminus e) = \text{comp}(G) + 1$ .
2.  $e$  is not a cut edge,  $u$  and  $v$  belong to the same connected component of  $G \setminus e$ , and  $\text{comp}(G \setminus e) = \text{comp}(G)$ .

## Trees & Forests

**Lemma 3.1.** Let  $F$  be a non-null forest. Then  $\text{comp}(F) = |V(F)| - |E(F)|$ . If  $F$  is a tree, then  $|V(F)| = |E(F)| + 1$ .

**Lemma 3.2.** Let  $T$  tree with  $|V(T)| \geq 2$ . Let  $X$  be the set of leaves of  $T$  and  $Y$  be the set of vertices of degree  $\geq 3$ . Then  $|X| \geq |Y| + 2$ . In particular,  $T$  has at least 2 leaves. **Lemma 3.3.** If a tree  $T$  has exactly two leaves  $u$  and  $v$ , then  $T$  is a path with ends  $u$  and  $v$ .

**Lemma 3.4.** Let  $v$  be a leaf in a tree  $T$ . Then  $T \setminus v$  is a tree.

**Lemma 3.5.** Let  $v$  be a leaf in a graph  $G$ . If  $G \setminus v$  is a tree then  $G$  is a tree.

**Lemma 3.6.** Let  $T$  be a tree,  $u, v \in V(T)$ . Then there exists a unique path in  $T$  with ends  $u, v$ .

## Spanning Trees

**Lemma 4.1.** Let  $G$  be a connected, non-null graph. Let  $H \subseteq G$  be chosen minimal such that  $V(H) = V(G)$  and  $H$  is connected. Then  $H$  is a spanning tree of  $G$ .

**Lemma 4.2.** Let  $G$  be a connected, non-null graph. Let  $H \subseteq G$  be chosen maximal such that  $H$  has no cycles. Then  $H$  is a spanning tree of  $G$ .

**Lemma 4.3.** Let  $T$  be a spanning tree of  $G$ . Let  $f \in E(G) \setminus E(T)$ . Then there exists a unique fundamental cycle of  $f$  with respect to  $T$ .

**Lemma 4.4.** Let  $T$  be a spanning tree of  $G$ ,  $f \in E(G) \setminus E(T)$ , and  $C$  be the fundamental cycle of  $f$  with respect to  $T$ . Let  $T' = (T + f) \setminus e$  be the graph obtained from  $T$  by adding  $f$  and deleting some  $e \in E(C)$ . Then  $T'$  is a spanning tree of  $G$ .

**Corollary 4.5.** Let  $G, T, f, C, e$  be as in Lemma 4.4. Let  $w : E(G) \rightarrow \mathbb{R}_+$ . If  $T$  is  $\text{mst}(G, w)$ , then  $w(f) \geq w(e)$ .

**Theorem 4.6.** Let  $G$  be a graph,  $w : E(G) \rightarrow \mathbb{R}_+$  be such that  $w(e) \neq w(f)$  for any  $e, f \in E(G)$  with  $e \neq f$ . Let  $T$  be  $\text{mst}(G, w)$  and  $E(T) = \{e_1, e_2, \dots, e_k\}$  be such that  $w(e_1) < \dots < w(e_k)$ . Then for every  $i$  with  $1 \leq i \leq k$ ,  $e_i$  is the edge of minimum weight subject to  $e_i \notin \{e_1, \dots, e_{i-1}\}$  and  $\{e_1, \dots, e_i\}$  does not contain the edge set of a cycle.

**Theorem 4.7.** Kruskal's algorithm outputs  $\text{mst}(G, w)$ .

**Cayley's formula.** The complete graph on  $n$  vertices has  $n^{n-2}$  spanning trees.

## Euler Tours & Hamiltonian Cycles

**Facts.** A walk uses two edges incident to a vertex each time this vertex occurs in the walk (except for ends); thus if an Eulerian trail exists, then at most two vertices odd degree; if an Euler tour exists, then all vertices must have even degree.

**Lemma 5.1.** Let  $E(G) \neq \emptyset$  and suppose  $G$  has no leaves. Then  $G$  contains a cycle.

**Lemma 5.2.** Let  $G$  be a graph such that every vertex of  $G$  has even degree. Then there exist cycles  $C_1, \dots, C_k$  in  $G$  such that  $(E(C_1), \dots, E(C_k))$  is a partition of  $E(G)$ .

**Euler's theorem.** If  $G$  is a connected graph such that the degree of every vertex of  $G$  is even, then  $G$  has an Euler tour.

**Corollary 5.4.** If  $G$  is a connected graph such that  $G$  contains at most two vertices of odd degree, then  $G$  has an Eulerian trail.

**Lemma 5.5.** Let  $G$  be a graph. If there exists  $X \subseteq V(G)$  with  $X \neq \emptyset$  such that  $G \setminus X$  has more than  $|X|$  components, then  $G$  has no Hamiltonian cycle.

**Dirac.** Let  $G$  be a simple graph on  $n \geq 3$  vertices. Suppose that for every pair of non-adjacent vertices,  $u, v \in V(G)$ ,  $\deg u + \deg v \geq n$ . Then  $G$  has a Hamiltonian cycle.

**Corollary 5.7.** Let  $G$  be a simple graph with  $n \geq 3$  vertices. Suppose that either

- $\deg v \geq n/2$  for all  $v \in V(G)$ ; or
- $|E(G)| \geq \binom{n}{2} - n + 1$ .

Then  $G$  has a Hamiltonian cycle.

## Bipartite Graphs

**Lemma 6.1.** Trees are bipartite.

**Theorem 6.2.** Let  $G$  be a graph. TFAE:

1.  $G$  is bipartite;
2.  $G$  contains no closed walk of odd length;
3.  $G$  contains no odd cycle.

## Matchings

**Fact.**  $\nu(G) \leq \frac{1}{2}|V(G)|$ .

**Lemma 7.1.** Let  $G$  be a loopless graph. Then  $\nu(G) \leq \tau(G) \leq 2\nu(G)$ .

**Lemma 7.2.** A matching  $M$  in  $G$  has maximum size iff there does not exist an  $M$ -augmenting path in  $G$ .

**Konig.** If  $G$  is bipartite, then  $\nu(G) = \tau(G)$ .

**Theorem 7.4.** Let  $d \geq 1$  be an integer, let  $G$  bipartite such that  $\deg v = d$  for every  $v \in V(G)$ . Then  $G$  has a perfect matching.

**Hall.** Let  $G$  bipartite with bipartition  $(A, B)$ . Then  $G$  has a matching  $M$  covering  $A$  iff  $|N(S)| \geq |S|$  for every  $S \subseteq A$ .

**Menger.** Let  $s, t \in V(G)$  be a pair of distinct non-adjacent vertices of  $G$ , and let  $k \geq 1$  be an integer. Then exactly one of the following holds.

1. There exist pairwise internally disjoint paths  $P_1, \dots, P_k$  in  $G$  with ends  $s, t$ .
2. There exists a separation  $(A, B)$  of  $G$  such that  $s \in A \setminus B$ ,  $t \in B \setminus A$  of order  $< k$ .

**Theorem 8.2.** Let  $Q, R \subseteq V(G)$ ,  $k \geq 1$  an integer. Then exactly one of the following holds. (1) There exist pairwise disjoint paths  $P_1, \dots, P_k$  in  $G$  each with one end in  $Q$  and another in  $R$ . (2) There exists a separation  $(A, B)$  of  $G$  of order  $< k$  such that  $Q \subseteq A$  and  $R \subseteq B$ .

**Corollary 8.3.** Let  $G$  be a  $k$ -connected graph,  $s, t \in V(G)$  be distinct. Then there exist paths  $P_1, \dots, P_k$  in  $G$  from  $s$  to  $t$  that are internally disjoint.

**Menger 2.** Let  $s, t \in V(G)$  be distinct and  $k \geq 1$ . Then exactly one of the following holds. (1) There exist pairwise internally disjoint paths  $P_1, \dots, P_k$  in  $G$  with ends  $s, t$ . (2) There exists  $X \subseteq V(G)$  such that  $s \in X$ ,  $t \in V(G) \setminus X$ , and  $|\delta(X)| < k$ .

## Directed Graphs & Network Flows

**Lemma 9.1.** Let  $G$  be a digraph. Let  $s, t \in V(G)$ . Then there does not exist a directed path in  $G$  from  $s$  to  $t$  iff there exists  $X \subseteq V(G)$  such that  $s \in X$ ,  $t \in V(G) \setminus X$ , and  $\delta^+(X) = \emptyset$ .

**Lemma 9.2.** Let  $\varphi$  be an  $(s, t)$ -flow on a digraph  $G$  with value  $k$ . Then for any  $X \subseteq V(G)$  such that  $s \in X$ ,  $t \in V(G) \setminus X$ , we have

$$\sum_{e \in \delta^+(X)} \varphi(e) - \sum_{e \in \delta^-(X)} \varphi(e) = k.$$
